Hyperparameter tuning

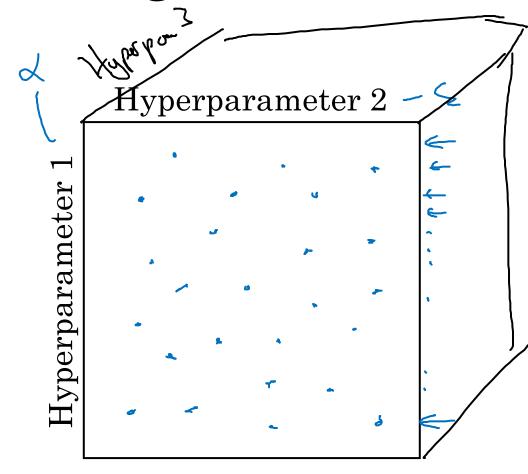

Tuning process

Hyperparameters

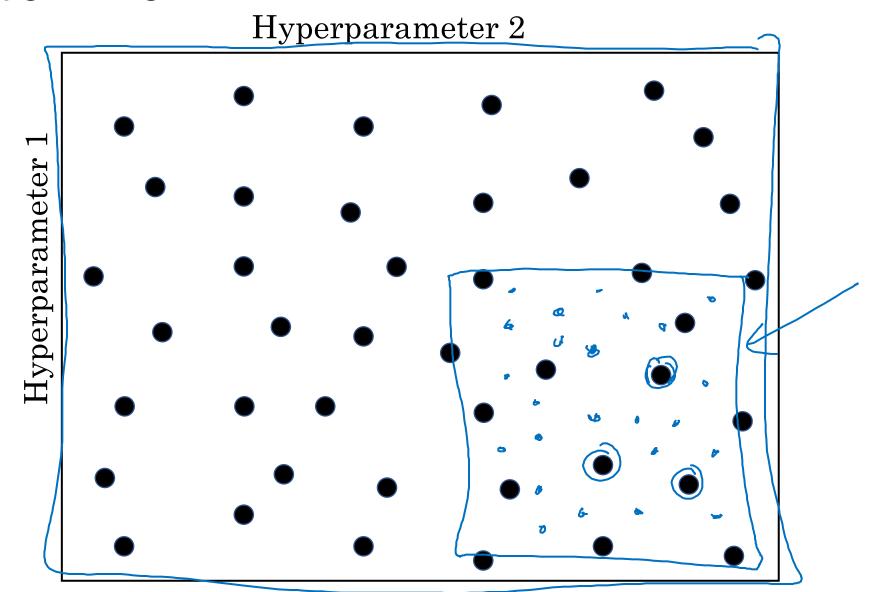

Try random values: Don't use a grid

Coarse to fine

Hyperparameter tuning

Using an appropriate scale to pick hyperparameters

Picking hyperparameters at random

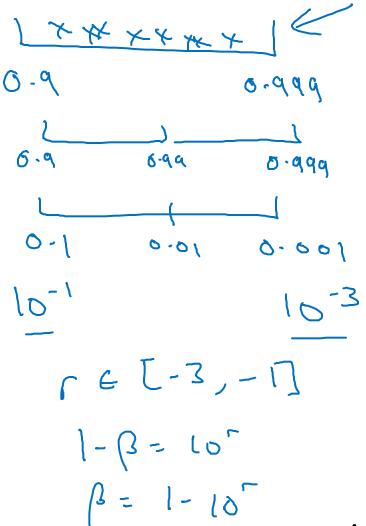

Appropriate scale for hyperparameters

$$\frac{10^{2} - 4}{4} = 10^{6}$$

$$\frac{10^{4} - 10^{6}}{10^{4} - 4}$$

Hyperparameters for exponentially weighted averages

$$\beta = 0.9 \dots 0.999$$

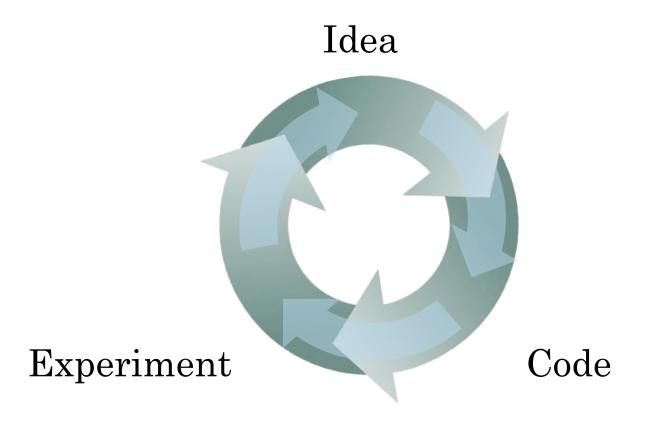

Hyperparameters tuning

Hyperparameters tuning in practice:

Pandas vs. Caviar

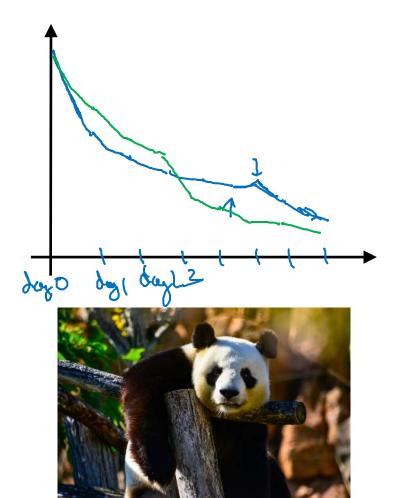

Re-test hyperparameters occasionally

- NLP, Vision, Speech, Ads, logistics,

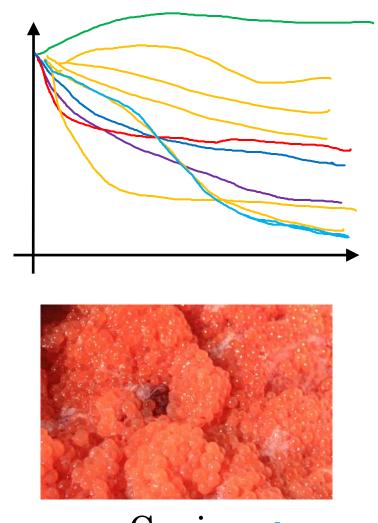

- Intuitions do get stale. Re-evaluate occasionally.

Babysitting one model

Panda <

Training many models in parallel

Caviar <

Batch Normalization

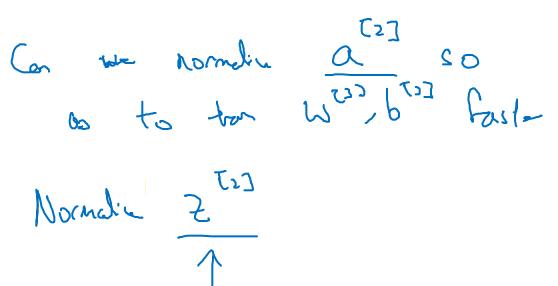

Normalizing activations in a network

Normalizing inputs to speed up learning

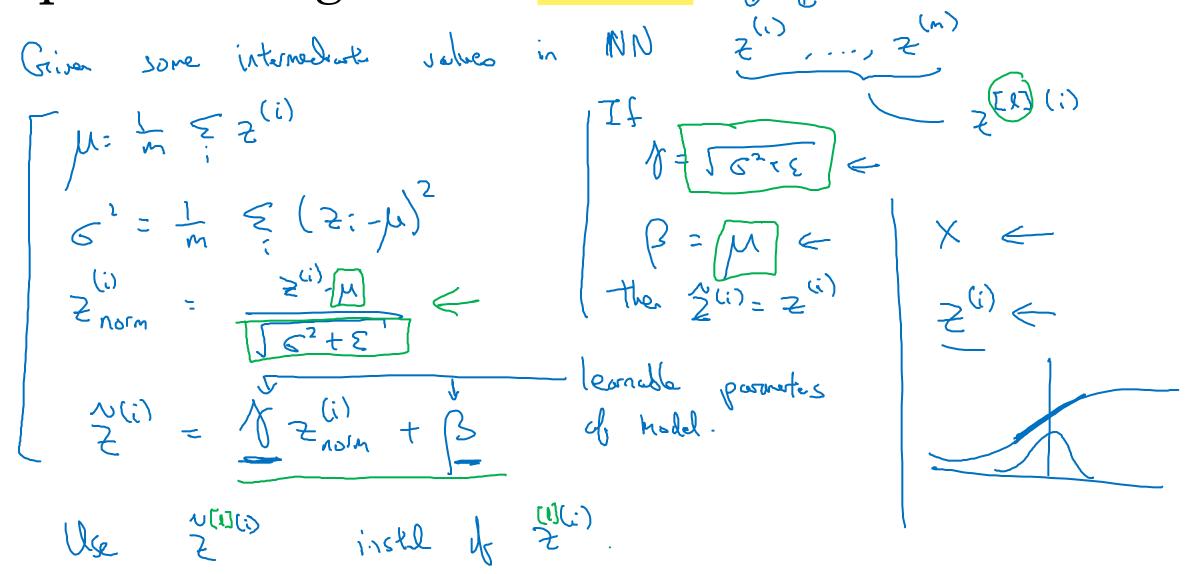

Implementing Batch Norm

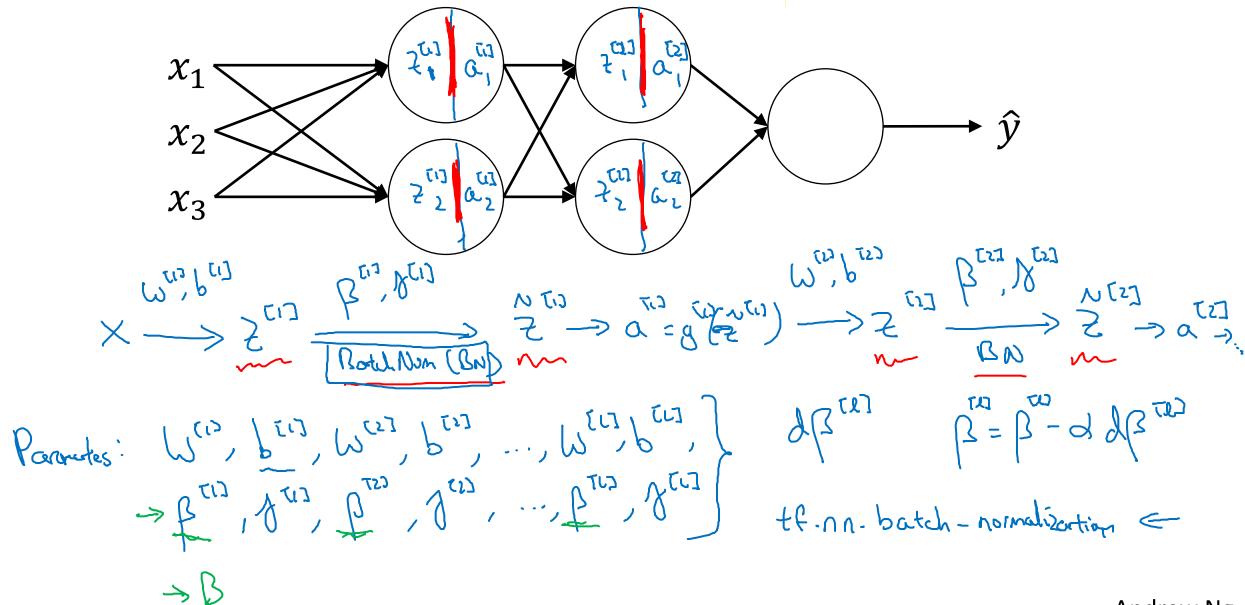

Batch Normalization

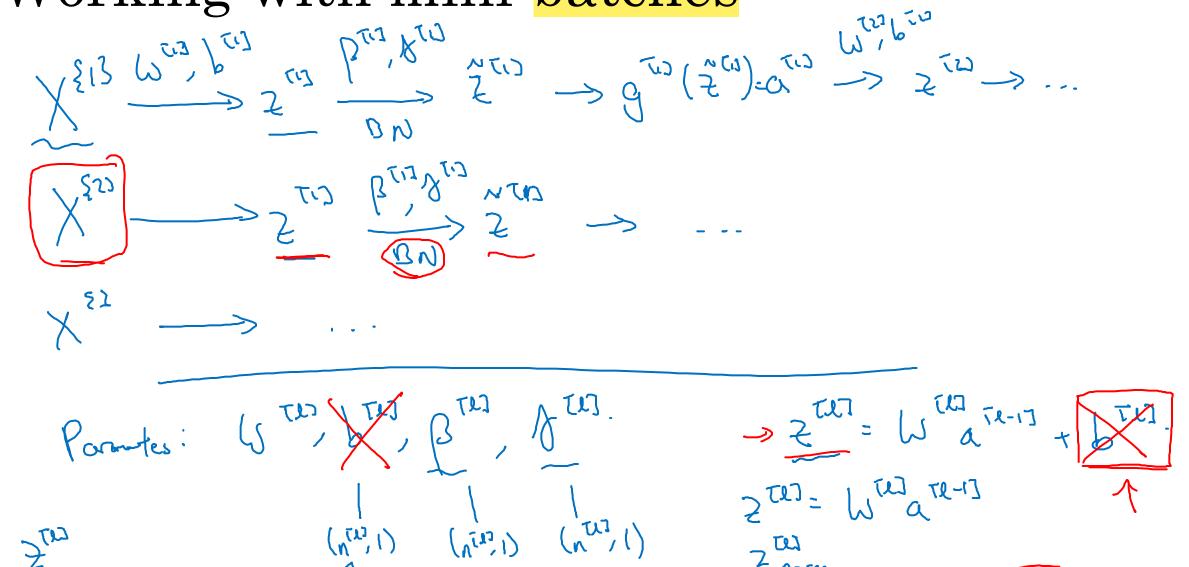

Fitting Batch Nor<mark>m</mark> into a neural network

Adding Batch Norm to a network

Working with mini-batches

(1, c47)

Implementing gradient descent

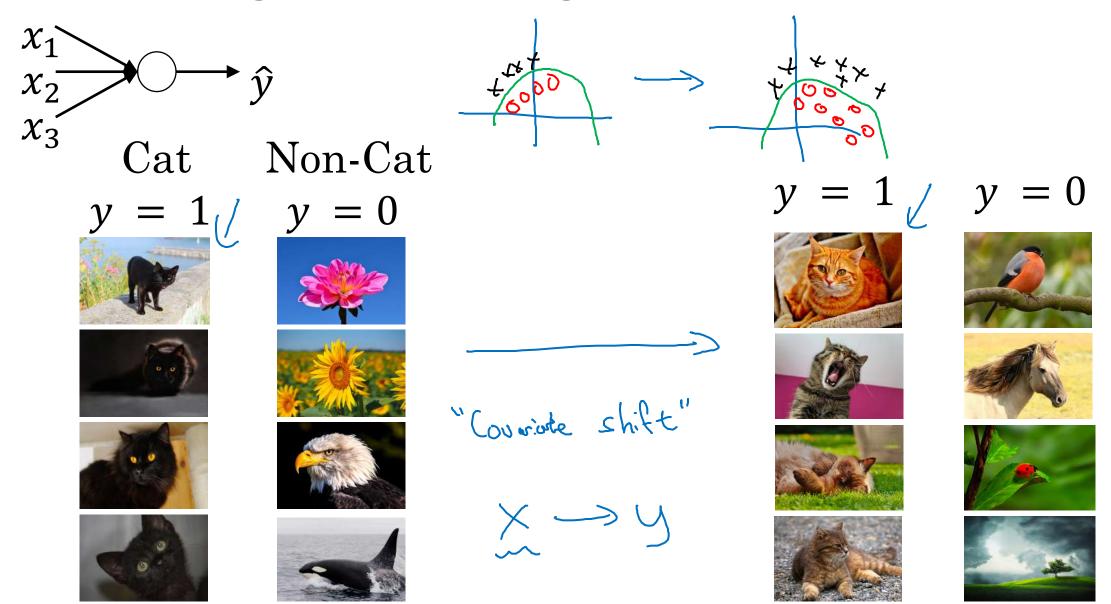

for t=1 num Mini Bortches Compute Cound Pap on X EtJ. It eat hidden lay, use BN to report 2 Tell with 2 Tell. Update partes Win = Win adwing } = Bin adwing Bin adwing } = Bin adwing Works w/ momente, RMSpap, Adam.

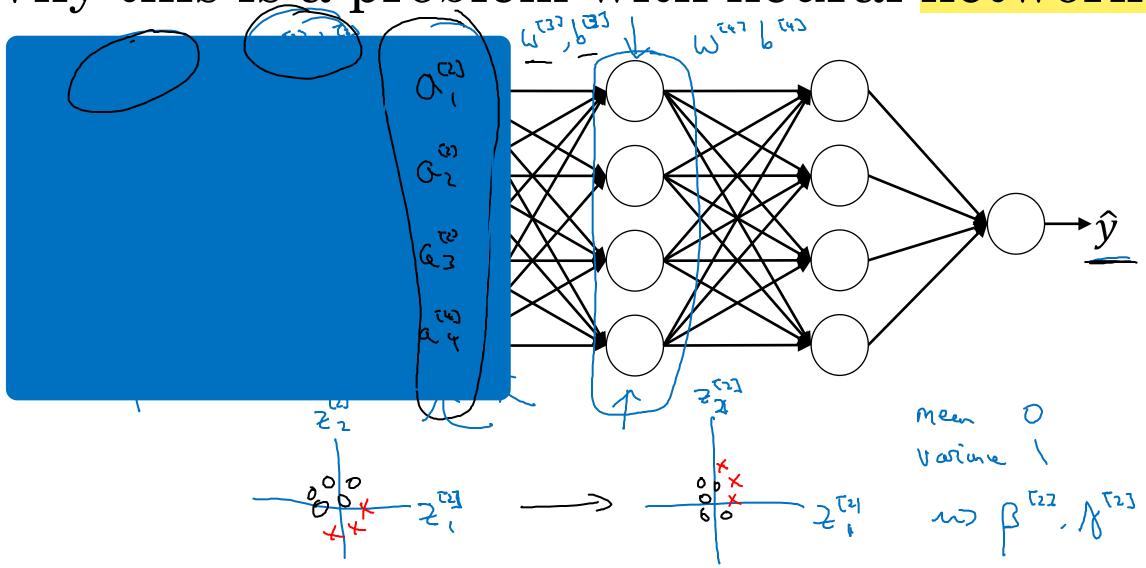

Batch Normalization

Why does Batch Norm work?

Learning on shifting input distribution

Why this is a problem with neural networks?

Batch Norm as regularization

- Each mini-batch is scaled by the mean/variance computed on just that mini-batch.
- This adds some noise to the values $z^{[l]}$ within that minibatch. So similar to dropout, it adds some noise to each hidden layer's activations.
- This has a slight regularization effect.

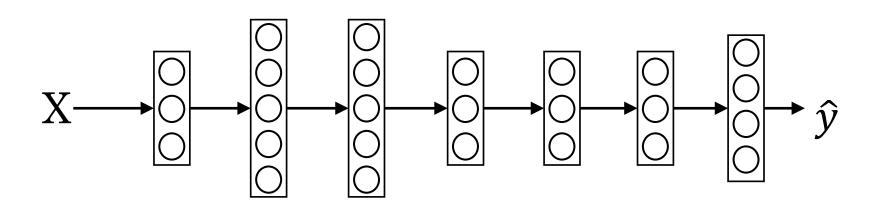

Multi-class classification

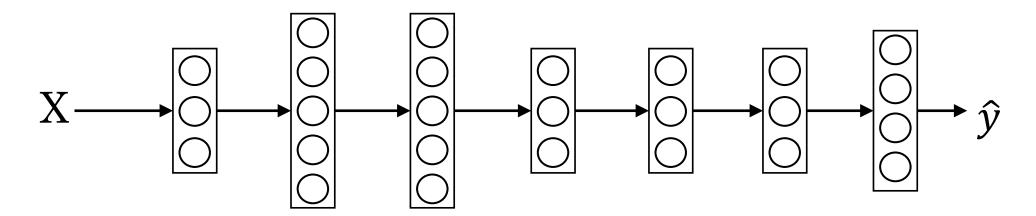

Softmax regression

Recognizing cats, dogs, and baby chicks

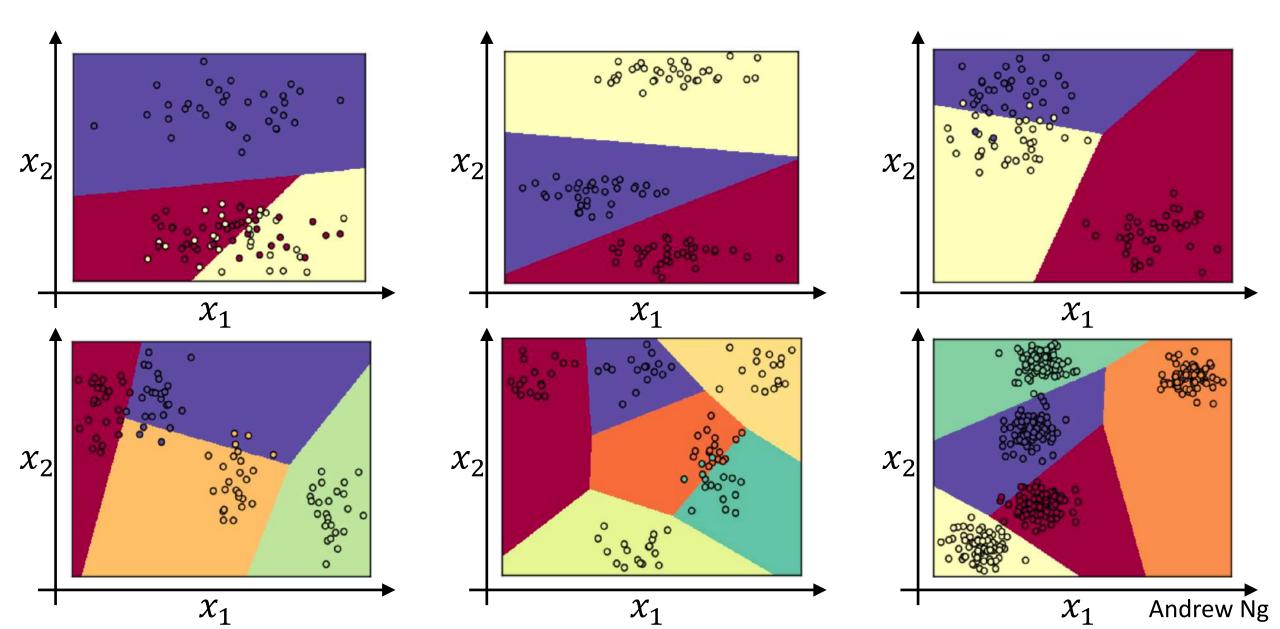

Softmax layer

Softmax examples

Programming Frameworks

Deep Learning frameworks

Deep learning frameworks

- Caffe/Caffe2
- CNTK
- DL4J
- Keras
- Lasagne
- mxnet
- PaddlePaddle
- TensorFlow
- Theano
- Torch

Choosing deep learning frameworks

- Ease of programming (development and deployment)
- Running speed
- Truly open (open source with good governance)

deeplearning.ai

Programming Frameworks

TensorFlow

Motivating problem

$$J(\omega) = \left[\frac{\omega^2 - 10\omega + 25}{\omega - 5} \right]$$

$$(\omega - 5)^2$$

$$(\omega = 5)$$

Code example import numpy as np import tensorflow as tf coefficients = np.array([[1], [-20], [25]]) w = tf.Variable([0],dtype=tf.float32) x = tf.placeholder(tf.float32, [3,1])cost = x[0][0]*w**2 + x[1][0]*w + x[2][0] # (w-5)**2train = tf.train.GradientDescentOptimizer(0.01).minimize(cost) init = tf.global_variables_initializer() with tf.Session() as session: session = tf.Session() session.run(init) session.run(init) print(session.run(w)) print(session.run(w)) for i in range (1000):

session.run(train, feed_dict={x:coefficients})

print(session.run(w))
